

Genpact Brings Agentic AI Into the Heart of Regulated Banking Operations

Dear Media Friends,

AI in banking is entering a new phase, moving beyond pilots to measurable business impact across operations that keep financial institutions running. Genpact's new Banking Analyst Suite brings Agentic AI into regulated banking workflows, starting with Genpact Transaction Monitoring Analyst, now generally available for AML alert investigations. The focus is clear: use AI to improve speed and efficiency without compromising human judgment, governance, or accountability.

Financial crime teams are increasingly under pressure from growing alert volumes, more sophisticated risks, and increasing regulatory scrutiny. Our solution leverages AI agents to assess customer behavior, analyze transactions, validate profiles, review prior alerts, and generate decision-ready recommendations, while analysts retain final decision-making authority. For in-scope investigations, the solution is expected to reduce handling time by up to 80% and total cost of ownership by up to 40%—helping banks improve productivity, manage costs, and direct expert attention to higher-risk cases.

The bigger opportunity is to embed Agentic AI into the everyday work of regulated banking and turn innovation into outcomes. Genpact plans to extend the suite across customer due diligence, screening, fraud, customer service, and other risk workflows. By combining AI with deep banking and operational expertise, Genpact aims to help financial institutions operate more efficiently, strengthen controls, and deliver better experiences for customers and employees.

Our leadership team would be happy to share our perspective on where Agentic AI is creating meaningful business impact, what we are seeing across the industry, and how we are helping clients solve real-world challenges. Please reach out if you'd like to explore the story further or speak with our experts about what we're seeing across the industry.

Regards,

Genpact Corporate Communications Team
