

Genpact Launches Banking Analyst Suite, Agentic AI for Regulated Banking Operations

New York -- Genpact (NYSE: G), an agentic and advanced technology solutions company, announced Genpact Banking Analyst Suite, an enterprise solution that applies agentic AI to regulated banking operations. Its first module, Genpact Transaction Monitoring Analyst, is now generally available to help banks complete routine anti-money laundering (AML) alert investigations faster and more consistently, and with human oversight and full auditability.

Built on Genpact's experience running financial crime operations for many of the world's leading institutions, including reviews of millions of alerts annually, the solution uses AI agents modeled after how AML investigations are conducted at scale. Genpact Transaction Monitoring Analyst coordinates AI agents to assess customer behavior, analyze transactions, validate profiles, review prior alerts, and recommend next steps. Analysts make the final decisions; the system does not take regulated action without human approval.

Financial institutions face rising alert volumes, increasingly sophisticated financial crime, and intensifying regulatory scrutiny. Compliance teams need to clear high volumes of low-risk alerts quickly and consistently, without weakening the governance and defensibility regulators require. Unlike tools that only score alerts, Genpact Transaction Monitoring Analyst completes the first-level investigation workflow and delivers a decision-ready recommendation with documented rationale and a detailed audit trail for analyst review.

“What sets Genpact Transaction Monitoring Analyst apart is the operating expertise behind the AI,” said Satish Acharya, Service Line Leader, Financial Crime & Risk Management, Genpact. “We have run financial crime programs for some of the world's largest financial institutions, and we have built that knowledge into how these AI agents investigate. This solution helps analysts shift time from repetitive alert work to the higher-risk cases where human judgment matters most.”

Expected Outcomes for AML investigations

For in-scope AML alert investigations, the solution is expected to deliver up to 80% lower handling time and up to 40% lower total cost of ownership, while strengthening investigation quality through more consistent and defensible reviews, with

documented rationale and a detailed audit trail for every recommendation. Genpact plans to expand the suite across additional regulated banking workflows, including customer due diligence, screening, fraud, customer service, and other risk areas.

The Banking Analyst Suite reflects Genpact's approach to combining AI with deep domain and operational expertise to help financial institutions improve the speed, consistency, and governance of regulated banking operations, while keeping human judgment at the center of decision-making.
